Description

Cross Reference to Related Applications

[0001] The present invention claims priority from U.S. Provisional Application No. 61/098,942 filed September 22, 2008 entitled "Multiheterocyclic Compounds for the Treatment of Allergy, Inflammation, and Immune Disorders."

Field of the Invention

[0002] Multiheteroaryl compounds, their preparation, pharmaceutical compositions comprising these compounds, and their pharmaceutical use in the prevention and treatment of prostaglandin D₂ mediated diseases and conditions that may be modulated by the inhibition of hematopoietic prostaglandin D synthase (H-PGDS).

Background of the Invention

[0003] Allergic and inflammatory disorders such as allergic rhinitis, asthma, chronic obstructive pulmonary disease (COPD), allergic conjunctivitis, and atopic dermatitis affect roughly one-fifth of the world population. Symptoms arising from antigenic challenge, including bronchoconstriction, bronchial hyperactivity, sneezing, nasal discharge, and nasal congestion, have been shown to correspond with the release of multiple mediators from inflammatory cells. Current therapies that effectively treat some of these symptoms have arisen out of compound classes including antihistamines, leukotriene antagonists, and corticosteroids. Many existing medicines suffer from side effects such as headache, sleepiness, sedation, dyspepsia, hydrodipsia, pharyngitis, and oral candidiasis. In addition, many of these individual therapies, although treating some symptoms, may fail to address a broader range of symptoms that affect patient quality of life. Antihistamines, for example, treat some of the most unpleasant symptoms of allergy, but have little therapeutic benefit against nasal congestion.

[0004] Immunological challenge results in the release of prostaglandin D₂ (PGD₂), the primary allergic and inflammatory mediator, from inflammatory cells. PGD₂, a metabolite of arachidonic acid, activates both the DP₁ (DP) and DP₂ (CRTH2) receptors, which play a central role in airway inflammation (Spik, I., Brenuchon, C., Angeli, V., et al. J. Immunol., 174, 2005, 3703-3708; Urate, Y., Hayaishi, O. Vitamin and Hormones, 58, 2000, 89-120).

[0007] H-PGDS is a 26 kDa cytosolic protein that catalyzes the conversion of PGH₂ to PGD₂ in a glutathione-dependent manner. This sigma class glutathione S-transferase (GST) is localized in mast cells, antigen-presenting cells, and Th₂ cells, and is involved in allergic and inflammatory response (Urate, Y., Mohri, I., Aritake, K., Inoue, T., Miyano, M. Functional and Structural Biology on the Lipo-network, 2006, 135-164; Kanaoka, Y., Urate, Y. Prostaglandinds Leukot. Essent. Fatty Acids, 69, 2003, 163-167).

[0008] H-PGDS inhibition provides a novel method for preventing and/or treating allergic and respiratory diseases or conditions through the suppression of PGD₂ synthesis. Most current therapies function subsequent to mast cell activation and/or degranulation and the formation and release of PGD₂. H-PGDS inhibitors, however, have been found to block the formation of PGD₂ in vitro (Ikai, K., Ujihara, M., Fujii, K., Urate, Y. Biochemical Pharmacology, 38(16), 1989, 2673-2676). In addition, the weak H-PGDS inhibitor HQL-79 has shown antiallergic and antiasthmatic activity in vivo.
Evidence suggests that the modulation of H-PGDS activity should be of therapeutic benefit in indications related to elevated PGD2 levels. These indications include, but are not limited to, allergic rhinitis, perennial rhinitis, rhinorrhea, nasal congestion, nasal inflammation, all types of asthma, COPD, allergic conjunctivitis, arthritis, atopic dermatitis and other types of dermal inflammation, ocular inflammation, wound healing, dermal scarring, and muscular necrosis (i.e. Duchenne muscular dystrophy; American Journal of Pathology, 174(5), 2009, 1735-1744). Efficacious doses of H-PGDS inhibitors may provide both therapeutic benefits and improved safety profiles over existing therapies used for these indications. Recent evidence also suggests that PGD2 produced by H-PGDS plays a role in fever induction (Journal of Physiology and Pharmacology, 60(2), 2009, 145-150).

Compounds have now been found that are inhibitors of H-PGDS, and at expected efficacious doses, do not significantly inhibit L-PGDS.

Palladium-assisted coupling of 5-bromo-2-iodopyridine or 5-bromo-2-iodopyrimidine (1) with the appropriate arylboronic acid (2) provided the corresponding 2-aryl-5-bromopyridine or 2-aryl-5-bromopyrimidine intermediate (3). A subsequent palladium-assisted coupling of an intermediate (3) with a 1-benzyl-2-\(R^2\)-substituted imidazole intermediate (4), which was prepared as illustrated in Scheme 2, provides the corresponding intermediate generally illustrated as structure (5). Debenzylation catalyzed with palladium on carbon affords the corresponding 5-(imidazol-4-yl)-pyridine or 5-(imidazol-4-yl)-pyrimidine (6).

For each of the examples and schemes below, temperatures, measurements, and time references are approximations and are not intended to be limited to the actual values listed.

Example 1

Preparation of 2-phenyl-5-(2-phenyl-1H-imidazol-5-yl)pyrimidine

Step A: Preparation of 5-bromo-2-phenylpyrimidine
A mixture consisting of 5-bromo-2-iodopyrimidine (Bridge Organics, 10.0 g, 35.1 mmol), benzene boronic acid (Alfa Aesar, 4.25 g, 35.1 mmol), \( \text{tetraakis(triphenylphosphine)} \) palladium (Strem, 0.405 g, 0.351 mmol), toluene (150 mL), and a 2 M aqueous sodium carbonate solution (35 mL) was stirred at 115 °C (degrees Celsius) under a nitrogen atmosphere for 16 hours. After cooling to room temperature, the mixture was partitioned between chloroform (250 mL) and brine (200 mL). The phases were separated and the organic phase was dried over anhydrous magnesium sulfate, and concentrated under reduced pressure to give an orange oil (9.1 g). The crude product was purified by flash silica column chromatography. Elution through a 500-g Analogix® flash silica cartridge with 100% hexanes afforded the title intermediate as a white solid (3.15 g, 38% yield). In a flask containing 3-fluorobenzonitrile (Matrix Scientific, 3.0 g, 25 mmol) was added methanol (30 mL) and sodium methoxide (Aldrich, 25% by wt. in methanol, 2.83 mL, 12.4 mmol). The reaction mixture was stirred for 1.5 hours and aminoacetaldehyde dimethyl acetal (Alfa Aesar, 2.60 g, 24.8 mmol) and acetic acid (2.83 mL, 49.5 mmol) were subsequently added and the solution was heated at reflux for one hour. After cooling to room temperature, methanol (25 mL) and 6 N HCl (8 mL) was added and the solution was heated at reflux for 16 hours. After cooling the solution to room temperature the residue was taken up in a 1:1 mixture (v/v) of water and ethyl acetate (50 mL). The aqueous layer was separated and the pH of this solution was adjusted to pH 9 with 2 N NaOH, upon which a white precipitate formed in solution. The solid was collected by filtration and dried under high vacuum to provide 2-(3-fluorophenyl)-1H-imidazole as an off-white solid (1.67 g, 41% yield, MS (ESI+): m/z 163.1 (M+1).

After stirring for one hour at room temperature, a solution consisting of benzyl bromide (Aldrich, 0.65 mL, 5.4 mmol) in N,N-dimethylformamide (5 mL) was added dropwise while stirring. After stirring at room temperatures for 12 hours the reaction was complete as observed by TLC. The reaction mixture was partitioned between ethyl acetate (150 mL) and water (100 mL). The phases were separated and the organic layer was washed with brine (100 mL), and was subsequently dried over anhydrous magnesium sulfate. Imidazole compounds of the exemplary embodiments may also be prepared using the general alternative synthetic route illustrated in Scheme 3. Examples 14-31 are imidazole compounds of the exemplary embodiments that were prepared at least in part according to the route illustrated in Scheme 3. Bromopyridines and bromopyrimidines of general structure 3 may be heated with tributyl(1-ethoxyvinyl)stannane in the presence of a palladium catalyst, such as palladium(II) acetate and a ligand, such as triphenylphosphate, in an organic solvent, such as 1,4-dioxane, to form the corresponding ketones of general structure 11, as shown in Scheme 3. Bromination of ketone 11 with a bromination
reagent such as tetrabutylammonium tribromide provides the corresponding α-bromoketone of general structure 12. Reaction of an α-bromoketone 12 with a carboxylic acid bearing a desired R₂ group or R₂ group precursor in the presence of a base, such as cesium carbonate in a solvent, such as tetrahydrofuran (THF) or N,N-dimethylformamide (DMF), provides the corresponding ester-ketone intermediate with the general structure 13. Reaction of an ester-ketone 13 with ammonium acetate in a solvent, such as toluene, with heating, affords the corresponding imidazole compound of general structure 14.

Scheme 3: Alternative general synthesis of 5-(imidazol-4-yl)-pyridines and 5-(imidazol-4-yl)-pyrimidines

[0193] An alternative method, described in Scheme 4, may also be used to prepare ketone intermediates with the general structure 11. Aspects of this methodology may be found in patent application publication WO 2009/080523 (Scheme 2, Steps I and J) and in Han, Ki-Jong; Kim, Misoo; Letters in Organic Chemistry, 2007, 4(1), 20-22. Starting from a prepared or commercially available carboxylic acid 15, reaction with triphosgene in the presence of excess amine base forms an activated carbonyl intermediate, which is subsequently reacted with N,O-dimethyloxyhydroxylamine hydro-chloride to provide the Weinreb amide intermediate 16. Reaction of the Weinreb amide with methylmagnesium chloride in THF provides the corresponding acetophenone 11 with good overall yield. Other methods for preparing ketones of this general type are known to those ordinarily skilled in the art.

Preparation of 5-(2-benzyl-1H-imidazol-5-yl)-2-phenylpyrimidine

[0194]
Steps A: Preparation of 1-(2-phenylpyrimidin-5-yl)ethanone

[0195]

A stirring mixture consisting of palladium(II) acetate (215 mg, 0.32 mmol) and triphenylphosphine (335 mg, 1.28 mmol) in 1,4-dioxane (25 mL) was heated at 80 °C for 30 minutes. The dark reaction mixture was cooled to room temperature, and to this reaction mixture was added a solution consisting of 5-bromo-2-phenylpyrimidine (Example 1A, 3.0 g, 13 mmol) and tributyl(1-ethoxyvinyl)tin (4.74 mL, 14.0 mmol) in 1,4-dioxane (63 mL). The reaction mixture was stirred and heated at 75 °C overnight and was subsequently cooled to room temperature. The reaction progress was monitored by thin layer chromatography (95:5 v/v hexanes-ethyl acetate) until completion. The reaction mixture was treated with 1 N hydrochloric acid (19 mL) for one hour at room temperature and poured into a saturated aqueous sodium bicarbonate solution. The organic material was extracted two times with a mixture of ethyl acetate and hexanes, and the combined organic phase was washed sequentially with water and brine, and was dried over anhydrous magnesium sulfate, filtered through a well packed pad of magnesium sulfate, and concentrated under reduced pressure. The residue was dissolved in dichloromethane (30 mL) and diluted with hexanes (30 mL). The resulting precipitate was filtered to give the title intermediate (872 mg). The filtrate was applied to a 80-g silica column eluted with 1:1:9 v/v/v ethyl acetate-dichloromethane-hexanes to afford 1.01 g of additional title intermediate (1.88 g total, 74 %); Rf 0.23 with 9:1 v/v hexanes-ethyl acetate solvent system; 1H-NMR (400 MHz; DMSO-d6) δ 9.4 (s, 2H), 8.45-8.50 (m, 2H), 7.5-7.7 (m, 3H), 2.68 (s, 3H); MS (ESI+) m/z 199 (M+1).

Step i: Preparation of N-methoxy-N-methyl-2-phenylpyrimidine-5-carboxamide

[0197]

To an ice-cooled solution (0 °C) consisting of 2-phenylpyrimidine-5-carboxylic acid (prepared according to WO 2007/041634 A1 Example 1, 2.10 g, 10.5 mmol) in dichloromethane (40 mL) was added triphosgene (1.55 g, 5.25 mmol) and triethylamine (7.3 mL, 52.45 mmol). Upon addition of triethylamine a yellow precipitate formed in solution. After stirring for five minutes in the ice bath, N,O-dimethylhydroxylamine hydrochloride (1.02 g, 10.5 mmol) was added and the solution was allowed to slowly warm to room temperature over 30 minutes. The reaction was complete after stirring for three hours at room temperature. The crude solution was filtered and washed with excess dichloromethane. The filtrate was concentrated under reduced pressure to afford an orange solid. The crude product was purified by flash silica column chromatography. Elution through a 40-g Silicycle® flash silica cartridge with 10-30% ethyl acetate in hexanes afforded the title intermediate as a colorless oil (1.85 g, 72% yield); Rf 0.23 with 1:1 v/v hexanes-ethyl acetate; 1H-NMR (400 MHz; CDCl3) δ 9.20 (s, 2H), 8.50 (dd, 2H), 7.55 (m, 3H), 3.62 (s, 3H), 3.42 (s, 3H); MS (APCI+) m/z 244.0 (M+1).

Step A: Preparation of 2-phenyl-5-(1-trityl-1H-imidazol-4-yl)pyrimidine
EP 2 350 059 B1

[0252] To a solution of 4-lodo-1-trityl-1H-imidazole (Synthonix, 2.0 g, 4.58 mmol) in THF (50 mL) at room temperature was added ethylmagnesium bromide (Aldrich, 1.0 M solution in THF, 5.5 mL, 5.50 mmol) under dry conditions. After stirring for 90 minutes, zinc chloride (Aldrich, 0.749 g, 5.50 mmol) were added to the reaction mixture. The reaction mixture was heated in a 70 °C oil bath overnight. Upon cooling, the reaction was diluted with dichloromethane and washed with 0.5 M EDTA buffer (at pH ~9) (2 x 250 mL) followed by brine (150 mL). The organics were dried over sodium sulfate, filtered, and concentrated. The crude product was purified by flash silica column chromatography using an 80g Silicycle® column (elution with 10-30% ethyl acetate in hexane) which afforded the desired intermediate, 2-phenyl-5-(1-trityl-1H-imidazol-4-yl)pyrimidine, as a white solid (1.38 g, 65%). Rf 0.87 with 95:5 v/v dichloromethane-methanol; 1H-NMR (400 MHz; DMSO-d6) δ 9.29 (s, 2H), 8.42 (m, 2H), 7.92 (d, 1H), 7.62 (d, 1H), 7.56-7.43 (m, 13H), 7.24-7.22 (m, 6H); MS (ESI−) m/z 463.0 (M−1); H-PGDS FPBA IC50: > 20 μM.

[0373] This assay essentially is available from Cayman Chemical Company as Catalog item # 600007. The test data reported for the aforementioned Examples (H-PGDS FPBA IC_{50}) were generated using a 96-well, instead of the 384-well, format.

[0374] Detection analyte and H-PGDS-MBP fusion enzyme were incubated in the presence of reduced glutathione (5 mM) for 60-90 minutes at room temperature and FP was measured using a TECAN SAFIRE 2 plate reader equipped with absorbance, fluorescence, fluorescence polarization and FRET capabilities. Assays were performed in 96-well microtiter plates in 100 μL of total sample volume. Excitation and emission wavelengths appropriate for the employed detection analyte were used.

**Step A: Preparation of Reagents**

(i). Detection analyte: H-PGDS FP fluorescent probe - green

[0375] FP buffer concentrate (4X (200 mM Tris pH8.0, 200 mM KCl, 20 mM CHAPS, 40 mM DTT), Cayman Chemical Catalog No. 600028, 6 mL) was diluted with deionized water (18 mL) to provide 1X FP buffer (24 mL).

[0376] A solution consisting of 2-(6-hydroxy-3-oxo-3'H-xanthen-9-yl)-5-(2-((2-phenylpyrimidine-5-carboxamido)ethyl)phenylsulfonylamido)ethyl(carbamoyl)benzoic acid in absolute ethanol (20 μL, 100 μg/mL) was diluted with 1X FP buffer (180 μL) to provide the H-PGDS FP fluorescent probe - green reagent.

(ii). Enzyme: H-PGDS-MBP fusion

[0377] H-PGDS-Maltose binding protein (MBP; 100 ul, 0.5mg/ml) fusion was diluted with 1 X FP buffer (900 μL).

(iii). HQL-79 FP positive control

[0378] Twelve clean microfuge tubes were labeled A1 through A12. A 5 mM 4-(diphenylmethoxy)-1-[3-(1H-tetrazol-5-yl)propyl-piperidine (HQL-79) in dimethyl sulfoxide (DMSO) solution (Cayman Chemical Catalog No. 600027, 100 μL) was added to tube A12. Dimethyl sulfoxide (50 μL) was added to each of tubes A1 through A11. The HQL-79 control solution was serially diluted by removing 50 μL from tube A12 and placing it in tube A11 with subsequent thorough mixing of the contents of tube A11. Next, 50 μL was removed from tube A11 and was placed into tube A10 with subsequent thorough mixing of the contents of tube A10. This process was repeated for tubes A9 through A2.

(iv). Glutathione (GSH) solution

[0379] A 100 mM aqueous (deionized water) glutathione solution (1,500 μL in vial) was obtained from Cayman Chemical Company (Catalog No. 600029).

**Step B: Preparation of assay cocktail**

[0380] Into a 50 mL conical tube was added the H-PGDS 1X FP buffer (18.65 mL), H-PGDS FP fluorescent probe - green (138 μL), H-PGDS-MBP fusion dilution (880 μL), and glutathione solution (1,250 μL). The cocktail prepared was enough for either a standard 96-well, 384-well, or higher density plate.

**Step C: Preparation of test compound solutions**

[0381] A test compound may be dissolved in DMSO, ethanol, or methanol at several concentrations when the titration endpoint is unknown. A final volume of 5 μL is added to each inhibitor well.

**Step D: Assay protocol (96-well plate format)**

(i). Apportionment of the assay cocktail

[0382] Assay cocktail (95 μL) was added to each plate well.
(ii). Preparation of maximum binding (100 % activity) wells

DMSO (5 µL) from microfuge tube A1 was added to each plate well A1 and B1.

(iii). Apportionment of HQL-79 positive control solution

Positive control solution (5 µL) from microfuge tube A2 was added to each plate well A2 and B2. Positive control solution (5 µL) from microfuge tube A3 was added to each plate well A3 and B3. This procedure was continued until all the positive control standard dilutions were aliquoted.

(iv). Apportionment of test compound solutions

Test compound solutions (5 µL) were added to the wells. Each test compound concentration was typically assayed in duplicate or triplicate. The IC50 for a particular test compound was obtained by performing a full concentration titration versus a full concentration titration of positive control. Comparison of a single concentration of a test compound to the maximum binding well provided an assessment of the relative affinity of the test compound for H-PGDS-MBP.

(v). Incubation

The plate was covered and incubated for 60-90 minutes at room temperature. The FP signal is stable for at least two hours.

(vi). Plate reading

Plates were read with excitation and emission wavelengths of 470 nm and 530 nm (for detection analyte comprising the fluorescein fluorophore), respectively. The measurements were taken in the fluorescent polarization mode with the z-height set to the middle of the well and the G-factor set to 1.13 on a Tecan Safire 2 reader.

Example 75

H-PGDS Inhibitor Enzyme Immunoassay

The assay detects and measures PGD2 generated by H-PGDS. The prostanoid product is quantified via enzyme immunoassay (EIA) using a specific PGD2 antibody.

The assay is carried out by the following steps:

1. Inhibitor screening is performed in 100 mM Tris-HCl, pH 8.0 containing 1 mM GSH, 1 mM MgCl2, 4 % inhibitor/DMSO, 40 µM PGH2 and 25 ng of PGDS in a total volume of 125 µL.

2. A reaction mixture containing 100 mM Tris-HCl, pH 8.0, 1 mM GSH, 1 mM MgCl2, 25 ng H-PGDS and 4 % inhibitor or DMSO (uninhibited reaction) is preincubated at 25 °C for 10 minutes.

3. Reactions are initiated using 5 µL of PGH2 and quenched every 15 seconds for one minute. Reactions are quenched by taking 10 µL of reaction mixture and adding to 490 µL of 100 mM phosphate buffer containing 0.1% BSA, 400 mM NaCl, 1 mM EDTA, 20 mM FeCl2, 10% 1N HCl, and 0.01% azide to prevent the non-enzymatic formation of PGD2 from PGH2. The FeCl2 serves the purpose of reducing PGH2 to 12-HHT. (Quench buffer is kept on ice at all times).

4. Quenched samples (5 µL) are further diluted 100 fold in 495 µL of 100 mM phosphate buffer containing 0.1 % BSA, 400 mM NaCl, 1 mM EDTA, and 0.01% azide for the PGD2 EIA assay. (Dilution buffers are kept on ice at all times).

The final 5000 fold diluted samples are analyzed following the protocol outlined in Cayman Chemical’s commercially available PGD2 EIA kit (Cat. # 512021). 50 µL of diluted sample is analyzed at least in duplicate in the EIA assay and the amount of PGD2 formed is quantified using a standard curve.

Other exemplary embodiments of the invention will become apparent from the detailed description provided hereinafter. It should be understood that the detailed description and specific examples, while disclosing exemplary embodiments of the invention, are intended for purposes of illustration only and are not intended to limit the scope of
the invention.
